 Anything caffeine needs to be stopped for 12 hours prior to the scan.
- The morning of the test you may have a light breakfast.
- No smoking from midnight the night before the test until the test is complete.
- Regular Stress Test (Afternoon appointment)
- Same as above except you may have breakfast and a light lunch before your test.

What is a Stress Test?

A regular cardiac exercise stress test is a painless, non-invasive test. This test measures the electrical (EKG/ECG) changes to your heart during stress - exercise.

What will happen during the Stress Test?

Electrodes are placed on your chest to monitor your heart rhythm and a blood pressure cuff is put on your arm.

You will then walk on a treadmill for as long as you can. The speed and slope of the treadmill will increase slowly. As you exercise, walking may get more difficult and your heart rate and blood pressure may rise, this is watched closely.

Let the therapist/technologist or doctor know if you have any chest pain, lightheadedness, feel nauseated or tired.

Your heart rhythm and blood pressure will continue to be monitored after you reach your exercise limit and for a short period after.

What will happen after the Stress Test?

You return to your normal activities. The supervising physician will send the stress test report to your physician. The results will be given to you by your physician.

At Thunder Bay Regional Health Sciences Centre, patients are first. As leaders in Patient and Family Centred care, we partner with patients and their families every step of the way to treat the person instead of the disease or injury.

As an academic health sciences centre, we teach the next generation of healthcare providers and advance medical research. Patients benefit from a team approach to care, and the chance to take part in clinical trials.

Your donation to the Health Sciences Foundation advances care in all areas.
